

Jintu Vincent K V

jintuvincent@gmail.com | +91-9400176781 | Ernakulam, Kerala

Key skills

- React
- Redux
- NextJS
- Express
- NodeJS
- PHP
- Laravel
- Mongo DB
- MySQL
- PostgreSQL
- AWS, Azure
- HTML/CSS/JS
- Selenium
- WordPress
- JIRA,Git,NPM
- SAP

Education

Bachelor in Computer Science and Engineering from MES college of engineering, India

Graduated 2015

Social Media

Summary

Full Stack Developer with 9 years of experience delivering scalable web applications and integrations across Australia (on-site in Melbourne) and India. Proficient in Node.js, React, Laravel, and AWS, with strong skills in Docker, CI/CD, and cloud infrastructure.

Career history

Full-stack Developer at Zagsa, Ernakulam

Mar 2025 – Present

Nodejs Payment Interface

Solely designed and developed a full-stack payment interface application using MERN stack and Docker for local development and deployment. Built the frontend with Next.js and Tailwind CSS and backend with Node.js and Express, implemented JWT authentication. Additionally, developed a custom WordPress plugin enabling a job/career module for WordPress sites.

Opalesque

Opalesque is an online media company providing news and market intelligence for the hedge fund and alternative investment industry. The original platform, built over 20 years using PHP 5.6 and Smarty templates, had grown increasingly complex, with architectural issues, numerous bugs, and several security vulnerabilities (XSS, SQL injection, cookie bypass).

As the sole developer, I fully replicated the production environment locally—replacing the unsafe practice of direct production edits—and analyzed the legacy system to understand its functionality. I then re-architected and rebuilt the entire system from scratch using a modern full-stack tech stack, deploying it in a Dockerized environment on AWS.

During this process, I implemented robust CI/CD workflows, containerized deployments, and best practices for security and scalability. The new system preserved all core functionality while eliminating vulnerabilities, improving maintainability, and enabling streamlined development and deployment workflows.

Founder of Clinare, Ernakulam

Feb 2023 – Feb 2025

Clinare Technologies Pvt Ltd is my first start up. I and my wife are the only developers who created this entire application from scratch. The Idea was inspired from my personal experience. There are many doctor who are doing private practice in their home. But no doctors have a website. In my place, patients need to write down in books in the morning for evening appointments. Then patients need to do the visit at evening. This is a headache for patients and they need to visit clinic two times. One to take appointment and other is for actual visit. Online Appointments can greatly benefit patients.

Clinare is a web application that build using Laravel, React and MySQL. For Every doctor/Clinic who signups will get free website that will be hosted in their own domain or in our subdomains. This website can be customised using free website builder tool attached to the dashboard. This website will have booking system attached to them. Doctors can manage their patients through their own websites. Clinare will create dedicated db for every client, that way system will be super-fast every time, because this will improve query time regardless of other client's data load.

Clinare comes with a website builder tool. Which can be used to customize websites. It is basically like wix to create and manage new websites. We have built this tool completely from scratch and attached to the clinare dashboard.

These whole system we build from scratch without the help of any npm packages. Clinare have strong architecture and wonderful user interface. My responsibilities include but not limited to develop the system, sales, marketing and other related operations.

External Projects

We have also developed several websites using Next.js with a serverless architecture. The backend was powered by AWS Lambda functions, with data stored in Amazon DynamoDB. We also integrated the WhatsApp API to enable automated customer notifications.

This architecture provided clients with a highly scalable, modern, and cost-effective solution for their web applications.

Full-stack Developer at Qubisoft, Melbourne, Australia

Oct 2022 – Dec 2022

Qubisoft was a software consulting company that designs and develop software for its clients. I was assigned with Basslink project. Basslink is bidirectional and enables Tasmania to supply some of the peak load capacity to the Australian mainland and take some of the excess power from the mainland when the generation on the mainland exceeds the demand.

Earlier they were bidding electricity charges through email but later they need an application to generate this bid and auto submit to the government on an hourly basis.

Application was build using ASP.NET , React and MySql. It was already there by the time I was joining the company. But somehow it was

producing incorrect bids. My task was to fixing those bugs and accommodating new user interface changes to the basslink application.

Technical Lead at Fluger, Melbourne, Australia.

Feb 2021 – Oct 2022

Fluger originally designed as a flu management system. But It is evolved to manage flu, covid, skincheck and other healthcare products. I have worked as Technical lead at fluger and managed seven member team. Fluger was originally using dream wear to update php code to the production servers. I have designed a workflow that create local, staging and production environment. I have written docker yml file to replicate server environment in local and utilized beanstalk and git for deployments.

I have provisioned new linux servers in cloud and configured apache servers. I have managed cloud architecture. My main responsibilities include creating new php applications that support booking system, facilitator portal, admin dashboard etc. I have integrated fluger with Australian Immunisation Record, so that we can record patient vaccination information to the government system. I have developed a middleware that used to outflow patient information to client legacy systems.

Foundwell

It was an external project for which Fluger provided technical support. The application was built using the MERN stack and designed as a social media platform for founders, known as Foundwell.

We developed the entire system from scratch. My primary responsibilities included (but were not limited to) front-end development, authentication management, and integrating the WordPress CMS so that live feeds from WordPress are displayed directly within the system.

I also deployed the application on an Azure VM and implemented CI/CD pipelines using GitHub Actions to streamline the deployment process.

Web Developer at Realizeonline, Melbourne, Australia.

Oct 2020 – Feb 2021

Middleware

Development of different middlewares that integrate ecommerce platforms, marketplace applications and ERP solutions. Including Shopify, Magento, Channel Advisor, SAP and Pronto. Middlewares are developed using Laravel frame work. It integrates process involving product creation, product upadation, product deletion, customer creation, order creation, cancellation and fulfilment etc. Also my responsibilities includes configuring and maintaining Nginx server, supervisor and Laravel queues.

Implementation Specialist at Envision digital, West Perth, Australia.

April 2020 – Sep 2020

Providing remote assistance for developing and hosting websites.

EnvisionBX

It is an Integration API between the BambooHR and Xero. BambooHR is a popular HR application and Xero is an Australian payroll software. We create a platform that integrate BambooHR and Xero. EnvisionBX make seamless data flow possible. So that our clients doesn't require to enter data manually anymore. This project was done using Laravel and React framework.

System Engineer at Tata Consultancy Services, Kochi.

March 2016 – March 2019

I have joined TCS fresher and they trained me as SAP Consultant. I had worked different SAP modules including SAP Basis, ABAP and FI.

Mars Chocolates

- Responsible for Analyzing and Monitor SAP Production Systems.
- Assigning different Roles for various users.
- Maintain the full potential and efficiency of production servers.
- Handling the various Authorization issues with users.
- Responsible to give the support for installing extra add-ons and various applications in SAP System.

World Bank

- Data validation in client database servers.
- Responsible for debugging customer specified application programs.
- Developing Report programs, as per the client needs.
- Developing module pool programs for client requirements.
- Analyzing the custom ABAP programs created specifically for the client.
- Responsible to ensure that the developed ABAP programs contains no defects and completely independent to other programs.
- Responsible for running the various Test cases on ABAP programs using TCS Fast-forward Tool.
- Updating the total scenario and execution result of ABAP programs in ALM.
- Responsible for submitting the status report of the Test cases.

ACE Hardware

- Responsible for analyzing the sales related problems
- Analyzing interrelated problem with the SAP system and other customer Application.
- Responsible for monitoring the Idocs.
- Monitoring the payment related issues.
- Responsible for fixing the vfx3
- Fixing invoice related issues
